QOP:

## Flow of control

So many function calls

Imagine if there are lots of functions in a pm → then overall code will be insecure, unstructured & difficult to change

We will prefer to save data related to one entity together.

∴ We can think of some User Defined datatype.

## Why OOPs invented?

1960 → Slow Crisis

OOP is a programming paradigm/methodology which is more resilient,  
looks more simple for outside world,  
is more flexible for future changes  
& can be modified as we move ahead with prog.

## How is OOP implemented?

→ Using Classes & Objects

# What is a class?

→ A class is a User Defined datatype used to wrap some data members & functions/methods.

To access properties of Student class, you need to create a variable of type class.  
These variables are called Objects.

```
1 public class Rectangle {  
2  
3     double length;  
4     double breadth;  
5  
6     void calculateArea() {  
7         double area = length * breadth;  
8         System.out.println("The area of Rectangle is: " + area);  
9     }  
10 }
```

Annotations:

- Class Name: `Rectangle`
- Data attributes (or Variables): `double length;` and `double breadth;`
- Member Functions (or Methods): `void calculateArea()`

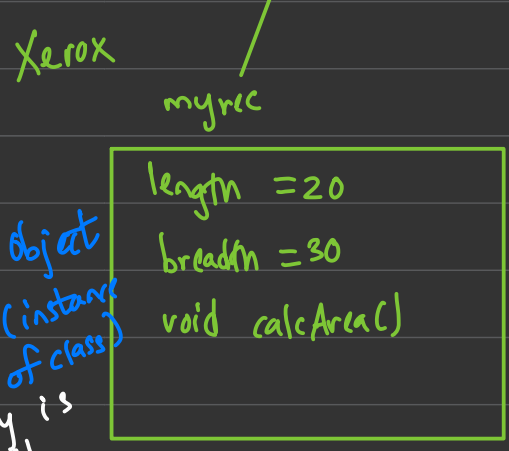

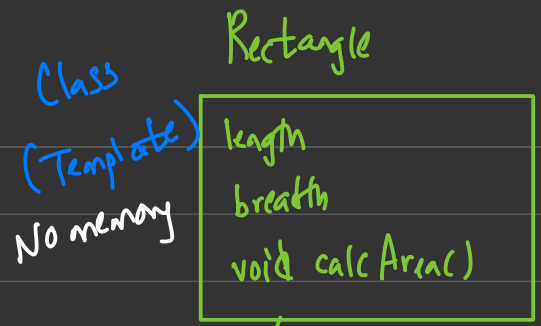

```
1 public class Demo {  
2     Run | Debug  
3     public static void main(String args[]) {  
4         Rectangle myrec = new Rectangle(); //first object created  
5         myrec.length = 20;  
6         myrec.breadth = 30;  
7         myrec.calculateArea();  
8     }  
9 }  
10
```

Annotations:

- Object of class Rectangle: `Rectangle myrec = new Rectangle();`
- Using object to access variables of methods of class Rectangle: `myrec.length`, `myrec.breadth`, and `myrec.calculateArea()`

```
1 public class Rectangle {
2
3     double length;
4     double breadth;
5
6     void calculateArea() {
7         double area = length * breadth;
8         System.out.println("The area of Rectangle is: " + area);
9     }
10 }
```

```
1 public class Demo {
2     public static void main(String args[]) {
3         Rectangle myrec = new Rectangle(); //first object created
4         myrec.length = 20;
5         myrec.breadth = 30;
6         myrec.calculateArea();
7     }
8 }
9
10
```

Op: The area of Rectangle is 600.0

Memory is allocated
